Q.53   A granular soil has a saturated unit weight of 20 *kN/m³* and an effective angle of shearing resistance of 30°. The unit weight of water is 9.81 *kN/m³*. A slope is to be made on this soil deposit in which the seepage occurs parallel to the slope up to the free surface. Under this seepage condition for a factor of safety of 1.5, the safe slope angle (in *degree, round off to 1 decimal place*) would be _____

Q.54   A 3 *m* × 3 *m* square precast reinforced concrete segments to be installed by pushing them through an existing railway embankment for making an underpass as shown in the figure. A reaction arrangement using precast PCC blocks placed on the ground is to be made for the jacks.
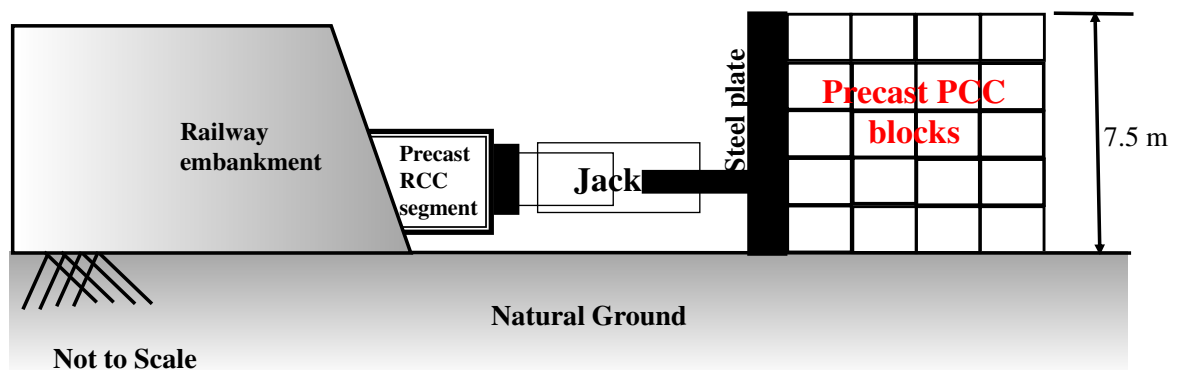

At each stage, the jacks are required to apply a force of 1875 *kN* to push the segment. The jacks will react against the rigid steel plate placed against the reaction arrangement. The footprint area of reaction arrangement on natural ground is 37.5 *m²*. The unit weight of PCC block is 24 *kN/m³*. The properties of the natural ground are: c = 17 *kPa*; ϕ = 25° and γ = 18 *kN/m³*. Assuming that the reaction arrangement has rough interface and has the same properties that of soil, the factor of safety (*round off to 1 decimal place*) against shear failure is _____

Q.55 A square footing of 4 *m* side is placed at 1 *m* depth in a sand deposit. The dry unit weight (γ) of sand is 15 *kN/m³*. This footing has an ultimate bearing capacity of 600 *kPa*. Consider the depth factors: $d_q = d_\gamma = 1.0$ and the bearing capacity factor: $N_\gamma = 18.75$. This footing is placed at a depth of 2 *m* in the same soil deposit. For a factor of safety of 3.0 as per Terzaghi's theory, the safe bearing capacity (in *kPa*) of this footing would be _____
